The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-16, 22, and 23 are rejected under 35 U.S.C. 102(b) as being anticipated by Alon et al. (USP-5,701,283).

Alon et al discloses a method for detecting a reproducing signal using an optical detection device to receive an optical signal reflected from an optical recording medium and dividing the received signal into multiple signals corresponding to sections of the optical detection device which are arranged in a matrix with rows in a tangential direction and columns in a radial direction of the optical recording medium. See figure 3. "As the positions of the disk tracks change relative to the pixel columns of detector matrix 62, for example, as a result of eccentricity of the optical disk, the track position computation function 80 adjusts the pixel select signals so that switches 132 continually select the pixel signals that correspond to desired disk tracks" (see col. 9, line 66 through col. 10, line 4). Thus, Alon et al discloses "selecting signals which are less degraded than other signals," as claimed. "While calculating track positions and determining the pixel select signals, track position computation function 80 also determines cross-talk cancellation coefficients..." (see col. 10, lines 32-35). Thus, Alon et al obtains a reproducing signal from the selected signals by compensating for an amount of the interference, as claimed.

Claims 17-21 and 24-32 are allowed.
